3 findings fixed **2** patterns retained **0** high-confidence issues left

Bloom interface follow-up

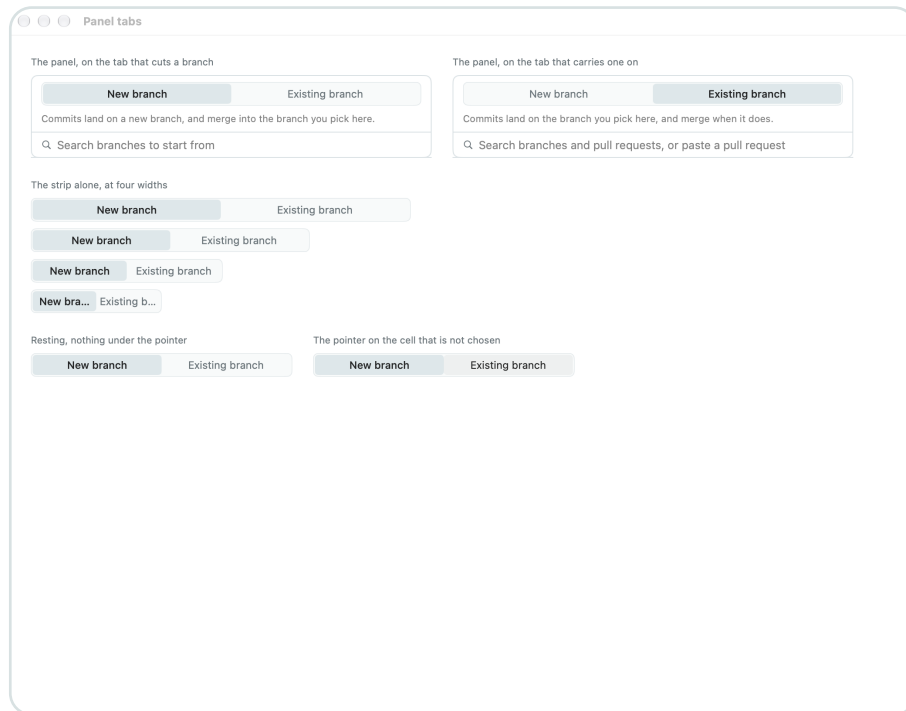

Clearer creation language

Short labels where space is scarce, system typography where guidance matters

1 Branch choice is easier to scan

FIXED

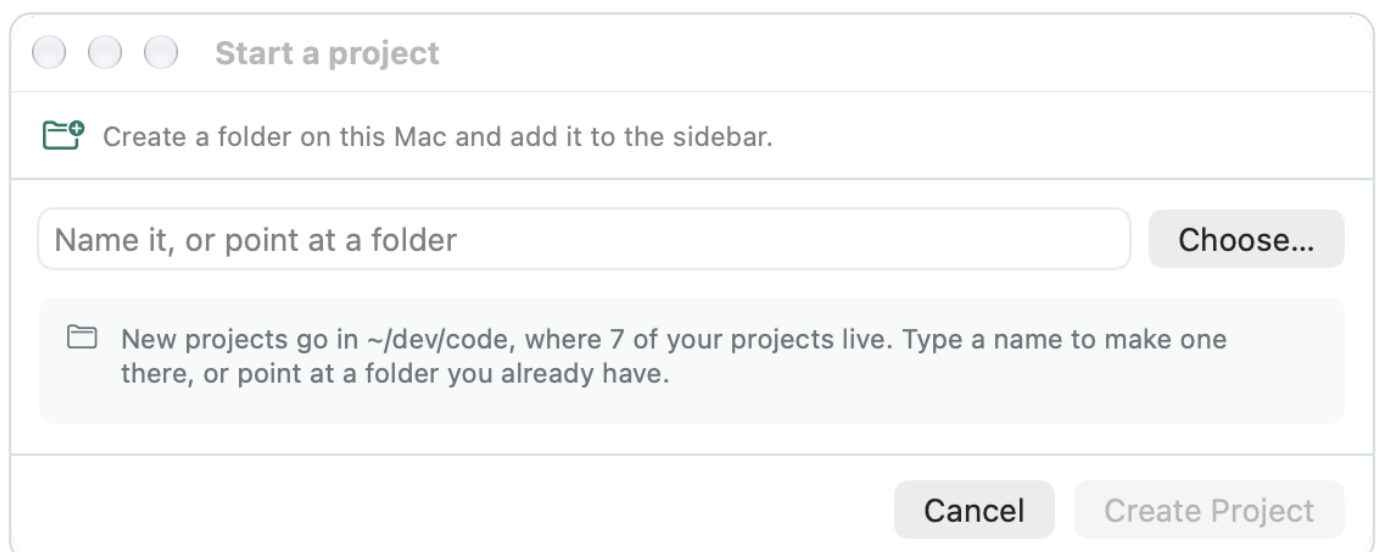

The segmented control used long verb phrases. At compact widths the distinction became hard to parse. It now says New branch and Existing branch, while the supporting sentence retains the full explanation.

2 Project setup no longer looks like code

FIXED

The introductory sentence and path entry used monospaced styling despite being normal interface copy. The guidance now uses the system caption, and the editable path uses the normal body face.

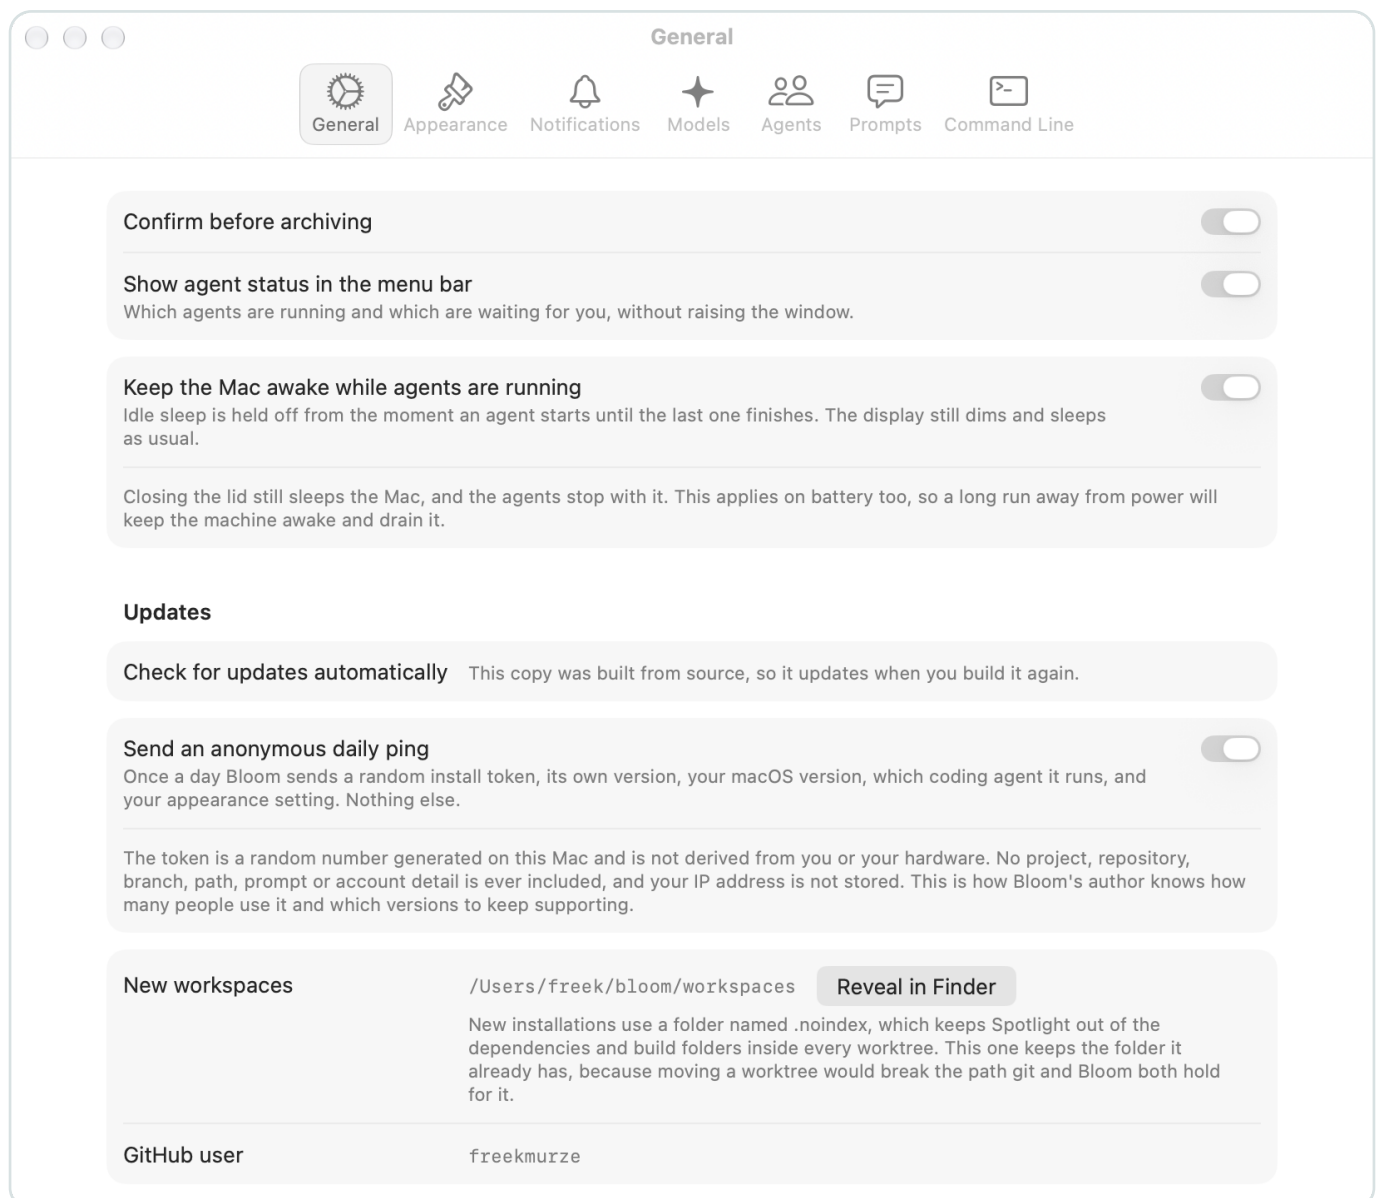

Settings notes belong to their controls

Supporting information now reads as part of the same preference group

3 Sleep and install-ping notes are contained

FIXED

Both explanatory notes previously sat outside their rounded settings groups like stray footers. They now sit inside the group with a quiet divider, matching the surrounding preference hierarchy.

Two patterns intentionally retained

A critical audit should also reject changes that would make the interface less coherent

4 Home scope selector

RETAINED

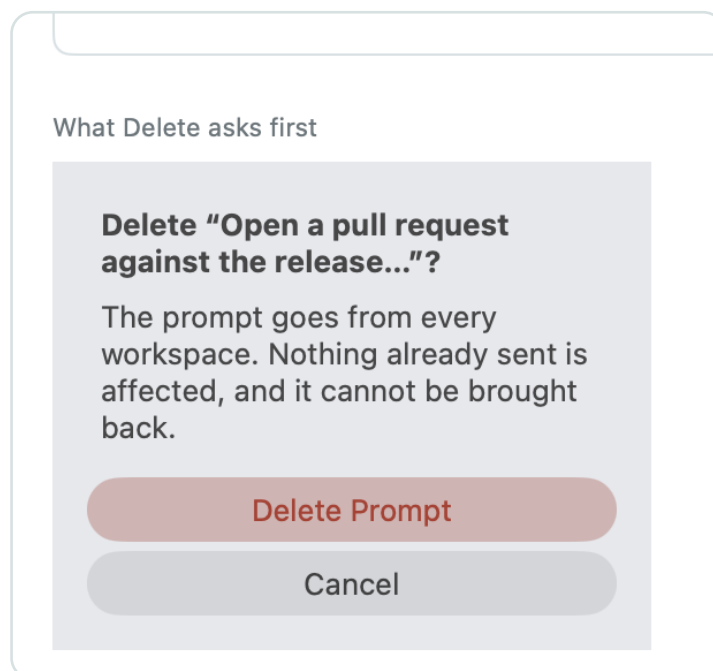

All and Archived already read as selected and unselected states of one lightweight control. Adding a full segmented track would make the quiet home toolbar visually heavier without adding clarity.

5 Quick prompt delete confirmation

RETAINED

The vertical action layout follows the app's shared confirmation sheet and keeps the destructive action explicit. A one-off compact dialog would introduce a second confirmation language for this single screen.

Final assessment

A second pass across the main window, sidebars, pane tabs, browser toolbar, inspector, creation flows, quick prompts, and settings found no additional high-confidence interface inconsistency.
